Answer

There is no direct answer to the question "Why energy prices are high in urban areas" provided in the context of this PDF.

However, it can be inferred that the increased energy demand and prices in urban areas may be due to various factors such as:

- 1. Higher population density
- 2. Increased economic activity
- 3. Growing use of appliances and devices
- 4. Higher vehicle usage (e.g., EVs)
- 5. Construction and development activities

The context does mention that residential buildings are a significant consumer of energy, but it doesn't provide a direct answer to the question about why prices are high in urban areas.

If you have any additional information or context, I may be able to help further.
